

A reliable foundation for portfolio carbon emissions disclosure.

Corporate emissions are complex. Most portfolios don't keep up.

Sustema CARBON turns fragmented issuer data and inconsistent GHG emissions data into a reliable, auditable baseline that investment, risk and sustainability teams can trust.

The Problem : Fragmented GHG data and shifting identities

Asset managers of all sizes face familiar operational hurdles: fragmented issuer names, inconsistent identifiers, and unnecessary manual effort. Reporting is only the visible part of the challenge. The real task is creating a repeatable process that makes portfolio GHG emissions comparable across funds, strategies, and reporting periods.

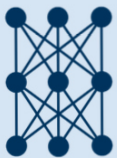

What Sustema CARBON does

- **Identifies and aligns** multiple representations of the same entity
- **Maintains** a consistent view of entity GHG emissions as they evolve over time
- **Maps** entities to multiple industry segment classifications - coherently and consistently across portfolios
- Enables **reliable client GHG emissions aggregation** within and across portfolios

Institutional-grade reporting for lean teams

- **Decision-ready outputs** - Connect emissions, sector and exposure data in one portfolio view.
- **Comparable baselines** - View emissions consistently across funds, mandates, and reporting periods.
- **Data quality transparency** - Show which values are reported, estimated or proxy-based.
- **Portfolio construction support** - Identify concentration and hotspots before they become reporting surprises.

Built for modern asset management teams

AI-Driven Resolution

Advanced models identify and **maintain entity relationships** across fragmented data sources, supporting consistency at scale

Global coverage

Built on data sourced from national company registers across jurisdictions, covering **300M+ entities globally**

Continuously updated

GHG emissions data, entity structures and relationships **refreshed multiple times daily** to reflect real-world changes

Auditable baseline

Entity mappings are **traceable and explainable**, supporting internal validation and governance needs

How it fits

- **Works with / alongside existing systems**
 - no replacement required
- **No core system replacement** required
- Designed for **continual updates**, not a one-off report, maintains consistency over time.

The result

Investment, risk and sustainability teams save significant time and manual effort by turning fragmented emissions data into a clearer, more accurate portfolio view — helping them understand current exposure, track change over time, and focus resources where they matter most.

Don't let fragmented data and shifting corporate identities obscure your true GHG exposure.

See how your portfolio looks when viewed on a reliable GHG emissions foundation.
